

Tidal Energy

B. Tide Physics

1. Lunar Tide

EARTH IS NOT A POINT, GRAVITATIONAL
FORCE VARIES WITH LOCATION

NET FORCE WILL BE DIFFERENCE BETWEEN
ACCELERATION & GRAVITY

↳ NO LONGER IN BALANCE

CONSIDER FORCE ON MASS OF WATER m

$$P_1: F_{P1} = \frac{GMm}{(D-r)^2} + m(r-L')\omega^2$$

$$P_2: F_{P2} = m(L+r+L')\omega^2 - \frac{GMm}{(D+r)^2}$$

$$P_3: F_{P3} = \phi \frac{GMm}{D^2} = mL'\omega^2$$

$$F_{P1} = F_{P2} = mL\omega^2 \left(1 + 2\frac{L'}{D}\right)$$

NET FORCE ACTS OUTWARD → CAUSING 2
BULGES

Tidal Energy

B. Tide Physics

1. Lunar Tide

SIMPLE THEORY EXPLAINS BASICS OF WHAT IS OBSERVED, BUT THERE ARE DEVIATIONS

1. BULGES CANNOT MOVE AT 1600 km/hr REQUIRED BY EARTH'S ROTATION

→ TRAVEL AT 500 km/hr

→ LAGS THE MOON'S POSITION

→ EACH OCEAN BASIN DEVELOPS ITS OWN TIDES

2. MOON IS NOT ON THE EQUATORIAL PLANE

→ DO NOT GET 2 EQUAL TIDES

→ TIDE HEIGHTS WILL VARY

3. MOON MOVES AS EARTH ROTATES

→ CHANGE OF TIME BETWEEN TIDES

Tidal Energy

B. Tide Physics

2. Solar Tide

SUN ALSO PRODUCES TIDES

→ EXACTLY AT 12 hr INTERVALS

→ SUN DOESN'T "MOVE"

SUN TIDE RANGE IS 2.2 X LESS THAN LUNAR TIDE

• SUN IS MORE MASSIVE, BUT MUCH FURTHER AWAY

SUN TIDE MOVES INTO & OUT OF PHASE WITH LUNAR TIDE

TIDE HEIGHT IS EXPLAINED BY S-E-M. POSITION

RATIO OF SPRING TIDE RANGE TO NEAP TIDE RANGE ~ 2
